

## METUWind

**(1) What & how?** – It is a research center for wind energy established with the vocation of becoming the center of attraction at the national and international level with its innovative and competent designs/accreditation activities as well as its scientific and technological research on wind energy.

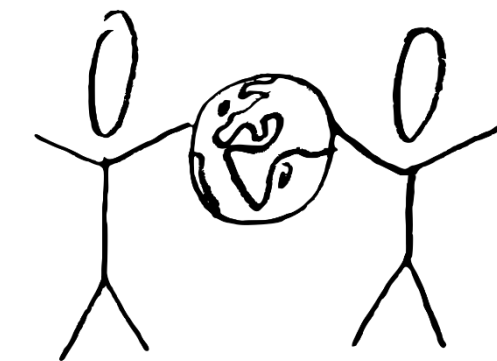

**(2) Where?** – Middle East Technical University in Turkey

**(3) Where to?** – supporting technological development for the efficient use of wind energy and leading to socio-economic improvement through:

- Architectural and regional integration
- Raising public awareness and appropriation about wind energy
- Adapting public needs and preferences on wind energy issues

**(4) Who?** – The Center is the result of a collaborative effort of 8 METU departments from faculties of engineering, architecture and economics and administrative sciences. It is funded by The Ministry of Development, and also is part of a number of national and international organisations

**(5) Ways beyond?** – *With the technological developments reached, can pave the way for new developments in sustainable energy use at both national and international levels.*

**(6) But!?** – They should be realistic to go outside the borders of the university and adapt to the city structure. It will not be easy to gain a place in the energy market where fossil energy is dominant. It is a long-term project.

**(7) What's more?** The most interesting aspect of the project for me is that it develops under the roof of the university I'm in and it brings people from different disciplines together.
